IN THE CLAIMS:

Please cancel 4-20 in their entirety without prejudice nor disclaimer of the subject

matter set forth therein.

Please amend claims 1-3 and add new claims 21-32 as follows.

1. (Currently Amended) A differential current driver having two output

terminals, a common node, a first current source supplying a first current to the common

node, through two switches connected to the common node and to the two output terminals,

and a circuit for selectively closing the two switches according to data to be transmitted, the

current source having a control terminal receiving a bias signal, the first current being

controlled by the bias signal, the differential current driver comprising:

a comparison circuit for receiving the bias signal and mirroring comparing the

first current to obtain a second current, comparing the second current with a reference value

and generating a first control signal having a value responsive to a difference between the

second first current and the reference value; and

a current adjustment circuit connected to the common node for diverting part

of adjusting the first current away from the switches responsive to the first control signal.

2. (Currently Amended) The differential current driver of claim 1, wherein the

current adjustment circuit comprises a transistor for shunting part of the first current to a node

different from the two output terminals and the common node.

3. (Currently Amended) The differential current driver of claim 2, wherein the

node different from the two output terminals and the common node is a ground node, and the

transistor has a source terminal connected to the ground node, a gate terminal receiving the

[first] control signal, and a drain terminal connected to the a common node through which the

first current passes from the first current source to the two switches.

Cancel Claims 4-20.

W697037.1

Please add new claims 21-32 as follows.

- 21. (New) A differential current driver comprising:
- a first transistor connected to a first node, the first transistor having a gate electrode connected to a second node;
  - a first switch circuit connected to the first node and a first output terminal;
- a second switch circuit connected to the first node and a second output terminal;
- a controller controlling the first and second switch circuits according to voltage levels of two input signals;
- a comparison circuit connected to the second node, for comparing a first current generated by a voltage level of the second node and a reference current and outputting a comparison result; and
- an adjustment circuit generating a current path between the first node and ground on the basis of the comparison result.
- 22. (New) The differential current driver of claim 21, wherein the first transistor is a p-channel metal-oxide-semiconductor (PMOS) transistor.
- 23. (New) The differential current driver of claim 22, wherein the first and second switch circuits are PMOS transistors.
- 24. (New) The differential current driver of claim 22, wherein the adjustment circuit is a PMOS transistor.
- 25. (New) The differential current driver of claim 21, wherein the comparison circuit comprises:
  - a second transistor having a gate electrode connected to the second node; a reference current source generating the reference current; and

Page 6

a differential amplifier connected to the second transistor and the reference current source and outputting the comparison result.

- 26. (New The differential current driver of claim 25, wherein the second transistor is proportional to the first transistor.
- 27. (New) The differential current driver of claim 26, wherein a drain current of the second transistor is smaller than a drain current of the first transistor.
- 28. (New) The differential current driver of claim 27, wherein the second transistor is a PMOS transistor.
- 29. (New) The differential current driver of claim 25 wherein the comparison circuit further comprises a current mirror circuit connected to the second transistor and the reference current source.
- 30. (New) The differential current driver of claim 21, wherein the controller comprises:
  - a first inverter receiving a first signal;
  - a second inverter connected to the first inverter;
- a first NAND circuit connected to the second inverter and the first switch circuit and receiving a second signal; and
- a second NAND circuit connected to the first inverter and the second switch circuit and receiving the second signal.
- 31. (New) The differential current driver of claim 30, wherein the first and second switch circuits are PMOS transistors.
- 32. (New) The differential current driver of claim 31, wherein the first NAND circuit is connected to a gate electrode of the first switch circuit, and the second NAND circuit is connected to a gate electrode of the second switch circuit.
